SMART INDIA HACKATHON 2026

Team IneffableX • ShilpSetu
Short Presentation Script (~4–5 minutes + prototype demo)

Slide 1 — Mohit | 25 sec

Good morning respected judges.

We are **Team IneffableX**, presenting **ShilpSetu** for SIH 2026.

Many marginalized artisans have great traditional products, but struggle with **digital cataloguing, language barriers, market access and fair pricing**.

ShilpSetu solves this by using **AI, voice interaction and offline technology** to take an artisan from a simple product photo to a market-ready listing.

Now, Himakshi will explain our solution.

Slide 2 — Himakshi | 40 sec

ShilpSetu makes digital selling simple.

The artisan simply **captures a product photo and speaks the details**.

Our AI then helps create the catalogue, enhance the product presentation, suggest a price range, translate the content and prepare it for marketplace listing.

The complete flow is:
Capture → **AI Catalogue** → **Price** → **Translate** → **Marketplace** → **Track.**

The artisan doesn't need to type complicated descriptions or understand complex digital tools.

Slide 2 — Shanu | 30 sec

What makes ShilpSetu different is four things:

AI-powered cataloguing, voice-first interaction, offline-first working, and market linkage.

Even with poor connectivity, catalogue work can continue and sync later.

Our goal is simple:
Connect local craftsmanship with wider digital markets.

Now Mohit will explain the technology.

Slide 3 — Mohit | 35 sec

Our technology is modular and offline-first.

We use **React Native and SQLite** for the mobile application, with a sync system for offline work.

For AI, we use **RemBG and OpenCV for images, Bhashini for voice and translation, an LLM for descriptions, and machine-learning models for price suggestions.**

The backend uses **Python and FastAPI**.

But instead of only explaining the technology, **let's see our working prototype.**

Prototype Demo | ~1 min

Mohit:

Here is the ShilpSetu workflow.

First, the artisan **captures the product** and provides information through voice.

The system then **generates the product catalogue**.

Next, it provides a **price suggestion**.

The content can then be **translated and prepared for listing**.

Finally, the product is ready for **marketplace visibility**.

So, from a simple photo and voice input, we reach a professional digital product listing.

Slide 4 — Nishant | 40 sec

ShilpSetu is feasible because it uses **proven and accessible technologies**.

The user journey is only:
Capture → **Speak** → **Review & Publish.**

Offline storage handles poor connectivity, while voice interaction helps users with lower digital literacy.

We can also scale through partnerships with **SHGs, NGOs and artisan cooperatives**.

We have considered key risks such as internet connectivity, dialects, noise and price trust.

Our principle is:
“AI handles the tech — the artisan leads the craft.”

Slide 5 — Jay | 35 sec

ShilpSetu can provide artisans with **year-round digital market access**.

It reduces the effort needed for photography, cataloguing, translation and online selling.

It can improve product presentation, support better price discovery and preserve the cultural story behind traditional crafts.

Ultimately, it means **more visibility and easier digital commerce for artisans.**

ShilpSetu is turning **traditional craftsmanship into sustainable digital opportunity.**

Slide 6 — Himani | 25 sec

Our solution is supported by research from sources including the **Ministry of Textiles, ICRIER, IndiaHandmade and ONDC**, along with technical references such as **Bhashini, RemBG, OpenCV, scikit-learn and SQLite**.

Our approach is:
Evidence-led. Open-source. Offline-first.

We don't want to replace the artisan's craft.

We want to remove the digital barriers between that craft and the market.

Thank you. We are **Team IneffableX**.
